The Problem in Today's Consultations

Fragmented Records

Medical data scattered across hospitals and labs, often trapped in unstructured PDFs

Time-Consuming Access

Doctors waste precious consultation time hunting for patient history

Clinical Risk

Missed allergies, past conditions, and drug interactions lead to suboptimal decisions

No Unified View

ABHA enables data discovery but doesn't provide aggregation or visualization

Current ABHA Ecosystem

1

Patient
Owner of health data

2

ABHA

- Verified Identity
- Consent Management

3

Hospitals

Data remains at source

Assumptions & Constraints

Hospitals link at least some patient records to ABHA

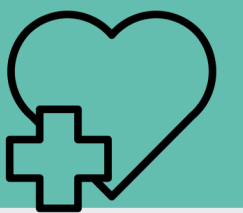

Data availability may be incomplete or delayed

Emergency access without patient consent is out of scope

No permanent storage of patient medical records

Proposed Solution

An ABHA-compliant clinical viewing portal that temporarily brings together a patient's available records from multiple providers, shows them in a clear chronological timeline, and automatically clears all data once the consultation ends.

End-to-End Consultation Flow

1

→] Doctor Login

Authenticate via hospital/clinic credentials

2

🔍 Enter ABHA ID

Doctor enters patient's unique health identifier

3

👤 Patient Consent

Biometric + OTP verification on patient device

4

⬇️ Record Fetch

System queries providers via ABHA rails

5

📄 Normalize & Aggregate

Data parsed, structured, and unified chronologically

6

👁️ Clinical Review

Doctor views allergies, conditions, history with trust...

7

🕒 Session Ends

Manual termination or automatic timeout

8

🔑 Key Destruction

Encryption keys destroyed, data unreadable

Security & Privacy by Design

Ephemeral encrypted session storage

Session-specific encryption keys

Key destruction on session end
(manual or timeout)

Audit logs retained (no medical data)

Who Benefits & How

DOCTOR

- Faster consultations
- Reduced cognitive load
- Safer clinical decisions

PATIENT

- Better continuity of care
- Strong privacy guarantees
- No data hoarding

Scope Boundaries

**Enforcing hospital
compliance**

**Emergency unconscious
access**

**Record editing or
modification**

Future Direction

Clinic-side upload tools

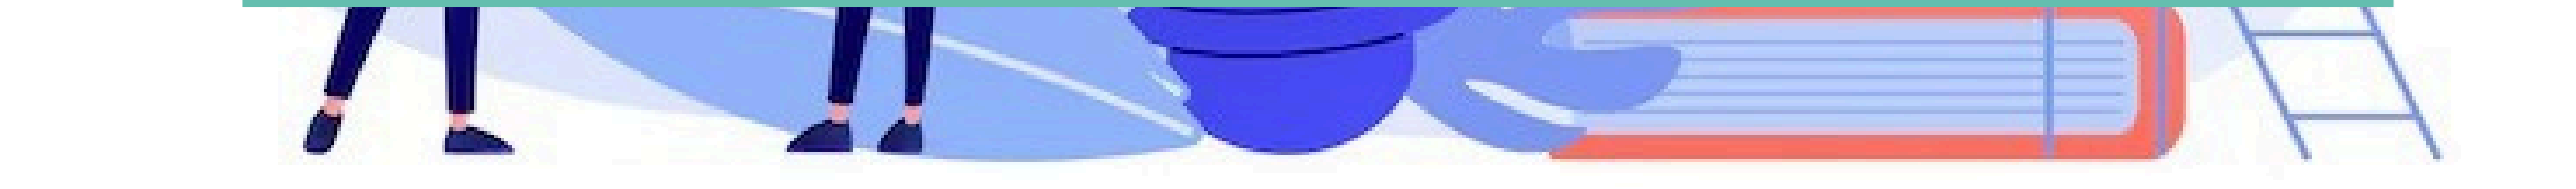

**Record trust & quality
scoring**

**Controlled emergency
access model**

Conclusion

**Improving clinical usability while respecting privacy,
consent, and system constraints.**
